SEARCH REQUEST FORM
Requester's Full Name: TANE ZALA Examiner #: 77512 Date: 10 - 12  Art Unit: 1635 Phone Number: 2-5765 Serial Number: 10/604, 72  Location (Bldg/Room#): 2018 Results Format Preferred (circle): PAPE DIS  ***********************************
To ensure an efficient and quality search, please attach a copy of the cover sheet, claims, and abstract or fill out the following:
Title of Invention: Bio IN FORMATICALLY DETECTABLE.
Inventors (please provide full names): Bentuich
Earliest Priority Date: 8-13-6.3
Search Topic: Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept to Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc., if known.
*For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent number, appropriate serial number.
please limit to 120 NTS.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

Detecting open chromatin comprises determining hybridization of the capture probe to the treated- and untreated-sample amplification products.

Example 1; Page 37; 43pp; English.

performing a second amplification using a second portion of the chromatin sample, where the second portion is not treated with the open chromatin DNA cleaving agent, to produce untreated-sample amplification products and the open products; incubating the treated-sample amplification products with a capture probe; and the untreated-sample amplification of the capture probe; and the untreated-sample amplification of the capture probe to the products, where probe, and where reduced hybridization of the capture probe to the capture of the amplification products hybridize to the products of the capture probe to the capture probe to the untreated-sample amplification products as compared to the hybridization of the capture probe to the untreated-sample amplification products as compared to the hybridization of the capture probe to the untreated-sample amplification products indicates the presence of open chromatin in the genomic DNA. Also given is a chromatin state profiling array, for detecting the presence of open chromatin in genomic DNA. The methods and chromatin state profiling array are useful for detecting open chromatin in genomic DNA, used in diagnostic and prognostic methods, and are useful for monitoring determining the hybridization of a capture probe to a treated sample amplification products and the untreated sample amplification products. Specifically, the method comprises preparing a chromatin sample from cells, the chromatin sample comprising genomic DNA segments or genomic DNA with one or more open chromatin sites; treating a first portion of the chromatin sample with an open chromatin DNA cleaving agent to produce fragments; performing a first amplification reaction using the fragments as a substrate, to produce treated-sample amplification products; are useful for uscenting year commenced and are useful for monitoring diagnostic and prognostic methods, and are useful for monitoring treatment and evaluating the response of cells and patients to candidate to care this the present sequence is a 3' reverse open chromatin in genomic DNA by chromatin or established therapeutic agents. The present sequence is a primer for one-sided PCR amplification of DNase I treated chr fragments, deposited on a chromatin profiling array new invention relates to detecting

RNA Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA target

Claim 95; SEQ ID NO 2144; 1266pp; English

the maturally occurring polymerase. Preferably the polymerase is a thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. socoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved background specificity in the nucleic acid cleavage structure comprises a RNA target nucleic acid (a cytochrome packground specificity in the nucleic acid (a cytochrome cleavage structure comprises a RNA target nucleic acid (a cytochrome generates an non-target cleavage of the invasive cleavage structure cleavage product, which is then detected by detecting fluorescence, mass or fluorescence energy transfer or by detecting radioactivity luminescence, phosphorescence, fluorescence polarisation or charge. The enzyme which for cleaving a nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme which produces at least one detectable cleavage product. The enzyme which produces at least one detectable cleavage product. The enzyme which produces at least one detectable cleavage of the mans, other animal or plants that are or may be associated with the animal or mans, the craft of the product or may be associated with This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered functionality in a nucleic acid cleavage assay. The enzyme comprises a 5' nuclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that

disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fungi, protozoa, ciliates and viruses, preferably detecting and identifying viruses having RNA genomes, such as hepatitis C and human immunodeficiency virus

nucleic acid sequence by attaching a adapter nucleic acid (AB000010-AB013409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (1). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid.

The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. [I) is useful for immobilising a target nucleic acid sequence by attaching a adapter imclaic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                               Array comprising adapter sequences useful for immobilizing or detecting target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with
                                                                                                                                                                                                                                                                                                               Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.
                                                                                                                                                                                                                                                                                               Human cervical cancer marker nucleic acid 193.
                                                                                                                                                                                                                                                                                                                                                                                                                                         (MILL-) MILLENNIUM PREDICTIVE MEDICINE INC.

The cdps sequences encode corn tassel-derived polypeptides (CDPs). The cdps sequences can be used for determining altered gene expression, to recover characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to
cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be

conditions or mixtures. The antisense oligonucleotides may be derived from sequences AX55219-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, including lung diseases, pulmonary vasoconstriction, impeded respiration, respiratory bulmonary vasoconstriction, emphysem, chronic obstructive pulmonary disease (COPD), and cancer such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, pepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                          GGGCGGGGGAGAGAGCGGCCCCCCUAAUUGUACUCGGGCCCGUAUUGUCUC 63

Claim 18; Page 419; 1343pp; English.

The present invention describes a new composition comprising an antisense

```
coligonucleotide (ON) with low adenosine (up to 15%), which targets
nucleic acids involved in bronchoconstriction, allergies, and/or
inflammation. The ON can have antiinflammatory, antiallergic,
antiasthmatic, cytostatic and analogesic activities. The compositions are
useful for the treatment of diseases associated with inflammation,
impaired airways, including lung diseases and diseases whose secondary
c effects afflict the lungs of a subject. They can be used for treating
c e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
impeded respiration, respiratory distress syndrome, pain, cystic
fibrosis, pulmonary hypertension, emphysema, chronic obstructive
c pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
carcinomas, and cancers which may metastasise to the lungs, including
breast and prostate cancer. The reduction of the adenosine content of the
c ONS reduces side effects. The A-containing ONS break down with the
crolease of deoxyadenosine which activates adenosine receptors causing
c bronchoconstriction and inflammation. AAA33312 represent the
c nucleotide sequences given in the sequence listing from the present
c invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
c sequences are also called SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
AAA3392) are specifically claimed ONS from the present invention. N.B.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthatic, bronchodilator, antinflammatory, analgesic.

(I) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthatic, such as stimulating cativities.

(I) can have respiratory disorders and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activating peptide factors and transmitters, transcription factors, immunoslobulina and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous and non-nervous system peptide receptors, adenosine receptors, bradykinin receptors, central creceptors, defensins, growth factors, bradykinin receptors, central creceptors, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction cand/or bronchoonstriction) which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, or suffactant hypoproduction which are associated with a disease or allegines, asthma, impeded respiration, respiratory distress syndome or one allegines, sthmation, expiration, respiratory is trained by any minmary ones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                          Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 7' or 2' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in a prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject; for reducing or depleting levels of or receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed producing allergies, or a respiratory disease or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a probe to test the method of the invention. The method of the invention is for amplifying a nucleic acid molecule. It comprises mixing at least one rolling circle replication primer (RCRE) with at least one amplification target circle (ATC) which comprises a single stranded circular DNA containing a region complementary to the CRCRP, such that the RCRP hybridises to the ATC and mixing the ATC-RCRP complex with a DNA polymerase and incubating such that a tandem sequence DNA is formed. The method, designated unimolecular segment amplification, is used for detecting specific sequences with high speed and sensitivity. It is especially useful for detecting mutations in genes where numerous distinct mutations are associated with a disease or where mutations in multiple genes are involved. The method is isothermal and provides a simple, consistent amplification occurs not in cycles but as a single continuous reaction. The method is strictly quantitative as the

                                                                                                                                                                                                                                                    This invention describes a novel composition, and active agency, composition describes and according to reducing adenosine (short) levels of adenosine (A) or (A) receptors, cauticating adenosine sensitivity, levels of adenosine (A) or (A) receptors, cauticating adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating (C) expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

CC device, in separate containers, (b) the oligonucleotides, (c) adelivery in the invention has antiallergic, antiinflammatory, antiasthmatic, of treating a respiratory, lung or malignant disease. The administered composition compasition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary charactery pain, cystic fibrosis, allergic thinitis, pulmonary characterion rejection, pulmonary infections, brain the breakdown of thy mand present in the target RNA serves to prevent the breakdown of the pain the products that free adenosine into products that free adenosine into transpersement of the prisonment and thereby the prison products that free adenosine into product that free adenosine or the prisonment and thereby.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lung, brain, heart, kidney, etc, tissue environment and thereby, to

     WPI; 2003-093058/08
```

```
The invention relates to a purified and isolated non-naturally occurring uncleic acid ligand (an RNA aptamer) to hepatocyte growth factor/scatter factor (HGF) or the HGF receptor, c-met. The ligand comprises a sequence selected from 148 fully defined sequences of 17-101 bp given in the selected from 148 fully defined sequences of 17-101 bp given in the genetication. Also included are a method of treating a tumour by administering the aptamer, a method for treating a tumour by individual, a method for inhibiting angiogenesis by administering the aptamer centical excipient), a method for treating the GC in which elevated HGF is a causative factor (by administering a disease comprising administering a mucleic acid ligand to HGF) and a method for inhibiting tumour development acid ligand to HGF) and a mucleic acid ligand to vascular endothelial factor (VGGF) and/or with a nucleic acid ligands to a tleast 2 receptors of growth factors and to relators, nucleic acid ligands to at least 2 receptors of growth factors in uncleic acid ligands to a least 2 receptors of growth factors in combination with nucleic acid ligands to one or more growth factors in uncleic acid ligands to one or more growth factors in uncleic acid ligands to do one or more growth factors or aptamers comprise 2 ** F(2 ** F(10vro)) modified tibonucleic acids The combination are useful as diagnostic and therapeutic agents for hypertension, arteriosclerosis, myocardial infarction and rheumatoid are useful for inhibiting tumourispensels by inhibiting containing modified information. Nucleic acid ligands to their are useful for inhibiting tumourispensels by inhibiting and and sequences of any or erability or inproved delivery or interaction are useful for inhibiting tumourispensels by inhibiting and adjagnostic and individual are improved in vivo grability or improved delivery or interaction are useful for inhibiting tumourispensels by inhibiting tumourispensels by inhibiting tumourispensels by inhibiting tumourispensels or interaction are useful for inh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        40N) surrounded by a constant region. The present sequence is an RNA sequence included in the sequence listing but not mentioned anywhere else

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                        Human, 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO 14603; 71pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 51 BP; 5 A; 23 C; 19 G; 4 T; 0 U; 0 Other;

nucleic acids.

```
This invention relates to a novel method (CE-SELEX, Capillary
CE Electrophoresis-Systematic Evolution of Ligands by Exponential
CC entichment) of identifying nucleic acid ligands of a target molecule from
a candidate mixture comprised of single stranded nucleic acids each
having a region of randomised sequence by contacting the mixture with the
CC target molecule, where nucleic acids having affinity to the target
collecule are partitioned from the mixture by capillary electrophoresis,
amplifying increased affinity nucleic acids to yield a ligand-enriched
compounds with an antiasthmatic, cerebroprotective, anti-HIV or
compounds with an antiasthmatic, cerebroprotective, anti-HIV or
cof compounds with an antiasthmatic, cerebroprotective, anti-HIV or
cof compounds with an antiasthmatic, areafolder mixture comprised of single
stranded nucleic acids each having a region of randomised sequence.
CC Aptamers identified by the method are useful as a tool in analytical
cof common and acids each having a region of randomised sequence.
Aptamers identified by the method are useful as a tool in analytical
cof common and acids each having a region of randomised and health
cresearch. Improved aptamers are useful in developing diagnostic assays,
cof nemistry useful in wide range of diagnostic assays and as diagnostic markers in medical analysis, in vivo imaging
and biosensors. The aptamers are useful in developing diagnostic assays,
cof recample as diagnostic markers in medical analysis, in vivo imaging
cof present in complex matrices. The aptamers are used to develop high

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the method of the invention. The present sequence is that of an aptamer DNA sequence which was identified using the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel genes (AAH68727-AAH73383) associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 5912 nucleotide sequences, appearing as BAX50072-ABX593, or complements of them. Also included are if it aransformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3, non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and cl polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and cl the 5912 nucleic acid sequences or its complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) where the sevel or pattern of the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule; and (c) detecting the level or pattern of the complementary nucleic acid sequences or its complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is used for the detection of the complementary nucleic acid is used for level or pattern of the molecule. The LMFD nucleic acid is used for the or pattern of the molecule. The LMFD nucleic acid is used for the sequence mapping, gene identification and analysis, cattle for genome mapping, gene identification and analysis, cattle breading, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 5912 bovine LMFD EST (expressed sequence was not shown in the specification but was obtained in the best of the construction of the construction but was obtained in the best of the construction of the construction but was obtained in the best of the construction of the constr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene

The invention relates to an anti-HM1.24 (I) antibody which has a modified sugar chain. Also included are an antibody composition, containing (I) in which the sugar chain ides not contain fucose and the relative ratio of the sugar chain is 30% or more and producing the antibody. The modified antibody is produced by culturing a host cell in which the ability of the cell to add fucose in the sugar chain of the antibody, is deleted, and in which the nucleic acid encoding the anti-HM1.24 antibody is introduced, by culturing a host cell in which nucleic acid encoding N-acetyl

Comparison of the antibody is introduced, and in which the nucleic acid encoding N-acetyl

Comparison of the antibody is introduced, and in which the nucleic acid encoding N-acetyl

Comparison of the subsection of the antibody is introduced, and in the cultured solution. The antibody does not contain alpha-1, 6 core fucose and/or has a sugar chain having a bisecting N-acetylglucosamine cluck tumor and is useful as a therapeutic agent for treating myeloma such as multiple myeloma. The antibody-dependent cellular cytotoxicity (ADCC) of the antibody) is enhanced by the sugar chain modification. The present comparison the present contain alpha-1, 6 core the antibody) is enhanced by the sugar chain modification. The present contain alpha-1, 6 core the antibody is enhanced by the sugar chain modification. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti-HM1.24 antibody useful for diagnosis of a tumor and useful as a therapeutic agent for treating myeloma, comprises a modified sugar chain.

Sanger Xenopus tropicalis EST project 2001
TROPICALIS_SEQUENCE_ID: TTPA036j08.plkSP6
Sequencing primer: $P6
Sequencing primer: $P6
Sequence is from a Xenopus Gene Collection (XGC) library
constructed by Nigel Garrett.
cDNA was oligo dT primed from sug of poly A+ RNA from tadpole
embryos. ECCRI-NotI cut CDNA was then ligated into pCS107 with
ECORI at the 5' end and NotI at the 3' end.
Vector: pCS107; Site 1: ECORI; Site 2: NotI
HOST: ESCherichia coli DH10B.

The library was constructed by Brandi Chiapelli and Dr. James
McCarter at Washington University, St. Louis. The CDNA was made by
McCarter at Washington University, St. Louis. The CDNA was made by
using Dynabead oligo-dr priming (Dynal). PCR based library using a
modified protocol from the SWART PCR cDNA Synthesis Kit from
Clontech. Directionally cloned into the UGG sites of pAMP1.
Dissected nematode tissues were provided by Dr. Alan Scott
(ascott@jhsph.edu) of the School of Public Hygene and Public Health
at John Hopkins University in Baltimore, MD.
Seq primer: T7 from Gibco
High quality sequence stop: 99.

The CDNA was made by using Dynabead oligo-dT priming (Dynal). PCR based library using a modified protocol from the SMART PCR CDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pAMP1, Dissected nematode tissues were provided by Dr. Alan Scott (ascott@lisph.edu) of the School of Public Hygene and Public Health at John Hopkins University in Baltimore, MD."

Roslin, Midlothian, EH25 9PS, UNITED KINGDOM Single pass sequencing. Bases called and trimmed with phred vo.020425.c. Vector identified by cross_match with the -minscore 20 and -minmatch 12 options. Vector:pBlueScriptII(KS) R. Sitel: ECORI R. Site2: NotI 5' Seq Primer M13F Normalised library constructed from pooled ovaries. Clones available from UK Centre for Functional Genomics in Farm Animals, Roslin Institite, Roslin, Midlothian, UK, EH25 9PS, www.ark-genomics.org.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anderson, S.I., Finlayson, H.A. and Archibald, A.L.
Development of cDNA and EST resources for studying reproduction and
embryo development in pigs and cattle

Patent No. 7034007
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: LOW ADENOSINE ANTI-SENSE OLIGONUCLEOTIDE,
COMPOSITIONS, KIT & METHOD FOR TREATMENT
OF ATREAY DISORDERS ASSOCIATED WITH
BRONCHOCONSTRICTION, LUNG INFLAMMATION,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

The present invention relates to a method for diagnosing disease or predisposition to a disease, associated with a disease causing mutations in a retinitis pigmentosa GTPase regulator (RPGR) gene involves genotyping a RPGR gene, and determining whether the genotype comprises a disease causing mutations, where the risk genotype is present within open
                                                                                                                                                                                                                                                                                                                                                                  Human; mutation; retinitis pigmentosa GTPase regulator; RPGR; genotyping; open reading frame; ORF; X-linked retinitis pigmentosa; XLRP; gene therapy; screening; forensic analysis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing disease or predisposition to disease, associated with disease causing mutations in retinitis pigmentosa GTPase regulator gene by genotyping ORF15 of the gene, and determining presence of mutations.
                                                                                                                                                                                                                                                                                                                                                    Imperfect direct repeat #1 of human RPGR exon ORF15 repetitive sequence.
                                                                                                                                                                                                                                                       ALIGNMENTS

ö
reading frame (ORF)15 of the RPGR gene. The method is useful for detecting a certain disease state e.g., X-linked retinitis pigmentosa (XLRP). The kit is useful for detecting and measuring disease causing mutations in biological fluids and tissues and for localising mutation in tissues. The mutant RPGR gene is useful in gene therapy techniques and tosues. The mutant RPGR gene is useful in gene therapy techniques and and/or the biological activity of mutant RPGR. They are preferably useful for identifying agonists and antagonists of RPGR. The mutant RPGR gene is also useful in identification of potential pharmaceutical targets in high throughput screening assays and forensic analysis. The present sequence is the imperfect direct repeat of human RPGR exon ORFIS repetitive DNA
                                                                                                                                                                                                                                                      Gaps
